

Tiffanie Rothwell - 00:00

Than what you're used to. Let me show you. This is where I live. Yeah. Yeah. How are you doing, by the way? Is this sound okay?

Teemu Lahdenpera - 00:09

Yeah, it's good. Yeah, I'm good, thanks.

Tiffanie Rothwell - 00:12

Perfect. I don't know what that means. Let me just stop suggesting on the go. Sure. Okay. Thank you so much for meeting with me. I have so many questions to ask you today. So Mike and I met with someone named James. He is a. I believe he was like a sales rep for Outbound. So I thought he might be the person to ask these questions to, but he actually referred me back to you, and I was like, oh, my God. Amazing. Because helped me out so much. So I'm so glad that he referred me to you. So Mike has 102,000 clients information, data since 2017. Everything that they buy, every product that they buy, how many times they come into the store, what their average basket size is, really.

Tiffanie Rothwell - 01:00

He's put a lot of effort and emphasis on collecting data for behavioral patterns in his clients that he has in his database. And he wants to now take it to a new level because he's tried to hire different kind of, like, you know, people that call on the phone. I even did it for a short amount of time trying to get clients to come back into the store or take a new promotion or see if they've gone to the competition, all the things like that. And he now wants to do voice agents because sending text messages is quite hard with our laws, whereas making client care calls is completely aligned with the compliance and laws that we have here within certain parameters, of course. So what I want to ask you is how to do it.

Tiffanie Rothwell - 01:55

Where do we start if we want voice agents? This is not a cold call. It's not a random list. It's really specific. And I would love to put an intelligence layer on top of it and kind of have. Have Claude tell me, like, okay, this client, this would be their message, you know, this client, this would be their message. Really, really specific and intentional. So, yeah, where do we start?

Teemu Lahdenpera - 02:20

Cool. Yeah. I mean, I've done a lot of similar builds myself for a client. So this lead recognition.

Tiffanie Rothwell - 02:26

Oh, my God. Beautiful. Okay.

Teemu Lahdenpera - 02:29

It's a great use case. I'd say, like, the biggest thing is just the legal aspect of it. Like, do you have content to call these people, but with the assumption that you do? It's quite simple. Technically, retail AI is the platform that I'm using and the one I recommend. And with retail AI.

Tiffanie Rothwell - 02:47

Retail AI.

Teemu Lahdenpera - 02:48

Okay, yeah, retail AI. And within retail AI, you can build the voice agent, quite simply, you just put in a prompt, the kind of parameters that you want, and then you give it this campaign list. So there's a campaign builder where you can say, like, here's the lead list that we have. And then you just put it into retail and then schedule the calls and then it does them. And then you need to have some components still there with an automation where you can, like, then analyze the data and then put it back into the CRM. But it's not like a super complex build and it's mainly just about the, like, do you have, like, the consent and how do you actually craft the campaign?

Teemu Lahdenpera - 03:25

Because you mentioned that you already had a lot of data on them, so how do you actually do the prioritization of that? And that's something that Claude can also do for you. So, like, I wouldn't think that would be that difficult either, if you have the data already.

Tiffanie Rothwell - 03:37

Meeting Title: Tiffanie Rothwell and Teemu Lahdenpera

Meeting created at: 13th Jul, 2026 - 1:00 PM

Yeah. And can you tell me. So if they've signed up, the reason that he has the data is because they're all loyalty clients. So every time they buy in the store, they get a 2% cash back and he gets their information that way. Would that stay in compliance? I guess I have to do some research on Canada and see what the rules are with that. So do you mind showing me what the platform looks like? I'm so glad that you've already done this, by the way. I feel so much more confident about this knowing that you, like, can give me this coaching.

Teemu Lahdenpera - 04:11

Yeah, sure. I'll show it to you. No worries. Just give me a second to open it. And it's actually something.

Tiffanie Rothwell - 04:22

Oh, sorry.

Teemu Lahdenpera - 04:24

Go ahead.

Tiffanie Rothwell - 04:25

I was going to say we can run through also maybe the cost or anything that you would kind of like to set me up for success kind of thing, knowing that it is a client base of 102,000, they most likely speak French as their first language. I'd love to know, like, is, are they dropping voicemails or are they actually having a conversation with this person, this client?

Teemu Lahdenpera - 04:49

I mean, yeah, it's an actual conversation. And then when it comes to the language, you can have it multilingual, so you can speak either English or French. So you can do that. All right, let me share my screen.

Tiffanie Rothwell - 05:03

Thank you so much.

Teemu Lahdenpera - 05:09

Can you see that?

Tiffanie Rothwell - 05:11

Yes.

Teemu Lahdenpera - 05:13

Yeah. So what you do is create an agent like this and then you just give it the prompt.

Tiffanie Rothwell - 05:20

Oh, wow. That's the whole script. So it's this prompt and the script. So you're basically giving it all the guidelines and it is Quite specific from what I see.

Teemu Lahdenpera - 05:30

Yeah, it's best to always script it out fully because that way you can actually optimize the conversion rate of it. So if you see, like, okay, well, this opening line isn't working, or this question is tripping people up, then you can modify that and then always keep improving the conversion rate. So, yeah, it's better to have it written like this.

Tiffanie Rothwell - 05:46

Could you give me an example what they sound like on your end? I guess maybe I'll share my concern with you and you can tell me if I'm just overthinking it, but does it sound like a bot?

Teemu Lahdenpera - 06:02

It doesn't. I'm not sure if I can actually share it here. Let me see if I can change it. You probably can't hear that, right? No.

Tiffanie Rothwell - 06:26

I don't know if on Google Meet, you can put your. I know on Zoom, we can put our computer microphone, but I'm not really used to Google Meet that much.

Teemu Lahdenpera - 06:37

Yeah, I think if I change tire.

Tiffanie Rothwell - 06:58

These are all of your voice agents. Wow, you have so many.

Teemu Lahdenpera - 07:04

Actually, this is not even like, the main account. This is just for, like, testing. We also have the one for clients.

Tiffanie Rothwell - 07:10

That's awesome.

Teemu Lahdenpera - 07:12

Maybe you can hear it.

Tiffanie Rothwell - 07:13

So you're looking. Oh, yeah, I can hear it. Yeah, I hear you. So you're looking into this for one of your clients then.

Teemu Lahdenpera - 07:21

Yeah, I was.

Tiffanie Rothwell - 07:27

Got it. What kind of business does your client run? Oh, my God, that sounds so real. That's so real. Okay, so this is very exciting. Mike is gonna freak out. Question for you. What's the best voice? What's the most success you've seen? What are some tips and tricks that you've kind of tested and thought through and kind of like, fast track me through that.

Teemu Lahdenpera - 07:53

Yeah. In terms of model, like Gemini 3 flash or 3.5 flash. Now, the newest one is the best LLM for voice. It's actually dependent on the ICP that you're calling. So what we do is we give the client three different options. Usually usually, like a young female voice, an old male voice. And then we kind of ask them, like, okay, well, your icp, like, which one would speak most to them specifically? And then we just let the client make that choice so they're happy with it.

Tiffanie Rothwell - 08:21

What's an ICP like?

Teemu Lahdenpera - 08:23

Ideal customer profile. Like, the people that you're calling, who would they respond most to in terms of voice?

Tiffanie Rothwell - 08:28

So interesting. So basically, when Mike gets a new client into the loyalty program, that becomes one of the criteria that they fill out at the cash. Okay, very smart. I Get that?

Teemu Lahdenpera - 08:39

And yeah, like, for example, like, if you're calling like homeowners, usually we have a young female voice because they seem to respond best to that. But in terms of like, maybe like changing it, like you can just have, you know, Mike make that decision or like you can make it like it's not that important, but it's just something that we add for clients.

Tiffanie Rothwell - 08:59

Yeah.

Teemu Lahdenpera - 09:00

And then here you can choose the language. So yeah, you have French, but.

Tiffanie Rothwell - 09:04

Okay. And you have to choose it from the beginning for that client. It can't be the client. I'm just thinking of working backwards. Let's say the 102,000 people that Mike has, there's no like English or French segment yet. Would it be able to know to switch languages if the person speaks English or not really?

Teemu Lahdenpera - 09:30

It can. Sometimes it can do like hiccups in those kind of transitions, but usually it's quite consistent still. So if you select like French and then English, then you can have the opening line, let's say in English, and then if the client says, like, francais or however you say it, then you can swap.

Tiffanie Rothwell - 09:48

Okay, super interesting. Okay, amazing. So then I guess I'm going to start setting this up and it'll be part of our coaching together. We'll be walking me through that. In terms of cost, what are we looking at?

Teemu Lahdenpera - 10:04

It's totally depending on usage. So usually on average for a production use case like this, it's about \$0.15 per minute.

 Tiffanie Rothwell - 10:13

Got it. So, yeah, it just depends on how long, right?

 Teemu Lahdenpera - 10:17

Yeah, like per minute that the call runs. But yeah, it's. The more there is spoken language, the more expensive it is, but usually about \$0.15 per minute of phone call.

 Tiffanie Rothwell - 10:28

Okay, and what do you set it up? Is it like Twilio or what's your back end setup?

 Teemu Lahdenpera - 10:34

Yeah, Twilio is what it gets the phone number from. And that's the thing that you'll have to connect.

 Tiffanie Rothwell - 10:41

Yeah. Yeah. Okay, cool.

 Teemu Lahdenpera - 10:45

And here is the campaign builder. So you just give it a name and then like, which phone number you want to use. And then you download the template where you can put the leads into. Then you just put the lead list here. And then you can either send the calls immediately or schedule them for certain days or.

Tiffanie Rothwell - 11:01

Yeah. And let's say the client says, thanks so much, I'm not interested. Like, does it handle objections? Do we kind of script that out? If the client says, okay, yeah, I'm coming in on Tuesday, reserve this product for me. Like, how does it let us know what that client call was really like.

Teemu Lahdenpera - 11:20

For Objections, ideally, like, you'd have as many of them in the script as possible so that you already find the best responses. But you can also just put a prompt in saying that, hey, use Alex Hormozi's objection handling framework to handle any unknown objections that you don't have scripted out. And it can actually do that quite well.

Tiffanie Rothwell - 11:38

Mike is going to freak out over what you just said. Cool. Okay. Also, he loves Alex Hormozi so much, he actually went down to meet with him, like, I think a couple months ago. That's awesome. Okay, so then, yeah, what is it? Like, do we get a notification saying, hey, this client answered, it was a good call, they're thinking about coming back into the store. What does that look like?

Teemu Lahdenpera - 12:02

It's something that you can build out yourself, either using just automation. Like, what I do is I write with plot code, a python script that captures every call from retail AI, then does the analysis, and then you connect the notification component. So, like, if you want to have an email notification, SMS notification, you can configure that, but it's kind of up to you how you want to present that data and analyze it.

Tiffanie Rothwell - 12:27

I get it. So you have to put an extra layer on it. You use Python and then that's how you get your extraction of the data. Okay, I understand. Okay. This is awesome. How are we doing for time? I have a few other questions for you. Let me just open up my notes. Okay. So, yeah, thank you. By the way, this was really cool. You're obviously, you know what you're doing, so I'm really excited for this. Okay, so I presented. I finished the project that you and I were working on the last couple months. We're now launching it in the company. So it was just a quick reminder of it. It was kind of a command center for all the different businesses. No, more like Monday.com and, you know, different project management platforms and all these different communications.

Tiffanie Rothwell - 13:18

We're all going to run them through aios. I haven't migrated into AIOS yet because I've just built the foundation, kind of like what you recommended. Once we get all the data that I need to build out everyone's bots, everyone's connections, everyone's workflow, then we're going to migrate onto AIOS only then. So that'll be kind of like the last step, and I'll probably need a lot of help with that, but that's where we're going. The question that I have for you is they currently use Go High Level. Mike would ideally like to either build a new Go High Level or use Go High Level in some way. So my question is, should we build or should we use Go High Level?

Tiffanie Rothwell - 14:04

Where does the AOS philosophy of like, you don't reinvent, you know, I guess my question is for a CRM, would you rebuild one or would you use one that's existing and plug it in?

Teemu Lahdenpera - 14:19

My preference is to just build a custom CRM.

Tiffanie Rothwell - 14:22

Yeah.

Teemu Lahdenpera - 14:22

Because then you have full control. So like for my business and for my voice AI agency, like, we have a fully custom system based on the subabase. If you want to use Go Level, that's fine. Like they have great APIs, so you can interface with all the data and you can even build this automation component within Go High Level. So if you want to trigger the call, you can build a trigger and Go High Level that triggers retail AI. So like you can do all of it within there. But it's a lot easier if you just use AIOS and then base it on something like Supabase.

Tiffanie Rothwell - 14:52

Yeah. I'm going to ask you this question. Feel free to, you know, answer however you want. I know Mike's going to ask it. So you just said something really interesting, that you've already built your own CRM and that you already have the voice agent solution. Also, is it something that you offer as a service outside of the AOS coaching that we can pay for you to develop that for our company?

Teemu Lahdenpera - 15:16

Yeah, like it's something that we sell to our clients too.

Tiffanie Rothwell - 15:19

Okay, amazing. I might be ready to ask you about that in maybe like two to three weeks, a month. I'll just have to work a little bit with what their data is so that I can present you the full scope of what all the companies are and what they're using. And I think it would make more sense, you know, for someone like you who has so much experience and can do it much better than me. So yeah, we'll circle. We'll definitely circle back from that. So next question is. Okay, so the Gmail integration I've set up all the bots for Telegram, they're working really well. The back end is super based. They go and get the tasks for the day. The email, not the email prep, but like the meeting prep.

Tiffanie Rothwell - 16:06

Now I want to build email bots and the email bots will specific parameters to go and notify Mike. He gets like, I don't know, like 2 to 300 emails in a day and maybe 10% of them are really important, but he kind of like skips over them because he's Got so much in his inbox.

Teemu Lahdenpera - 16:23

Yeah.

Tiffanie Rothwell - 16:23

My only concern is that the email bot like misses some important ones or includes some non important ones. What's your experience with email bots and how do I. Yeah. Set me up for success kind of thing?

Teemu Lahdenpera - 16:41

What kind of emails is it missing and what is it like, miscategorizing?

Tiffanie Rothwell - 16:46

Yeah, I haven't tried. This is his assistant who said that it's taken like, you know, spam emails and emails that don't really need Mike to take an action, but it's establishing an action. So I don't know if it's just the script that was

wrong or I guess. In your experience, do you have any Gmail bots currently and do they make mistakes or is it pretty straightforward?

Teemu Lahdenpera - 17:11

It's been pretty straightforward, but it's also like very down to the prompting of it. Like you need to be very specific with your prompts.

Tiffanie Rothwell - 17:17

Yeah.

Teemu Lahdenpera - 17:17

I've even built one for a client that was like full on SaaS that does this. So like it's a platform that you can log into and configure on your own inbox and that's been working like very well. So like it's just about prompting I think at this stage if it's just miscategorized.

Tiffanie Rothwell - 17:34

Okay, perfect. So then that's an easy solution I find with Claude. I'll just get the right prompt and that's what I'm going to work on this week. Okay, so that's great. How do you safely suppress spam? We just talked about that. Okay. When it comes to a bot in an email taking action or writing an email back on behalf of Mike, is there anything that you're seeing as like a do this or don't do this.

Teemu Lahdenpera - 18:00

If you're going to make something like that, it's better to have it write draft responses first into his inbox where he can then go approve and sign it.

Tiffanie Rothwell - 18:08

Of course. Totally makes sense. That answers that question perfectly. Okay, so right now I'm running all of our bots through EasyCron and then to GitHub Actions because the GitHub Actions wasn't like giving the exact time I had to go and pay EasyCron. The question I have is as we grow the number of bots and grow the amount of Easy cron to

GitHub actions, are there any like limitations? So for example, I used to use make.com a lot in my previous company and we had like so many automations and there was tons of mistakes, tons of problems, tons of them breaking because we had too many. Is there anything like that with EasyCron and GitHub Actions or is it pretty much like, I don't know, straightforward?

Teemu Lahdenpera - 19:00

It is quite straightforward, but you still need to maintain them to some degree. Just like checking up on them to make sure that they're all fine.

Tiffanie Rothwell - 19:08

Okay, I wouldn't get like with make.com I would get like a notification if one didn't do what it was supposed to do. Is that also what easy cron and GitHub Actions could do?

Teemu Lahdenpera - 19:20

It's good to also have a more dedicated monitoring set up for that. For example, Sentry IO. Sentry is basically like backend monitoring. So it checks the code and if there's some errors in the code then it can notify you directly.

Tiffanie Rothwell - 19:33

Okay, so it's its own kind of system for that. It's not like I will have to go and check. Sentry IO. You said?

Teemu Lahdenpera - 19:41

Yeah, Sentry IO.

Tiffanie Rothwell - 19:42

Sentry IO. Okay, cool. There's no calling infrastructure. Say that you answered and this you answered as well. So we talked about the voice agents, we talked about the CRM. Does for the emails. Does it have to be a dedicated Google workspace or can it be Mike's personal email? For the bots.

Teemu Lahdenpera - 20:14

It can be personal email. With personal email it's just a bit harder because doing the connection sometimes requires you to authenticate very frequently if you're using a personal inbox and there might be some troubles keeping the connection alive. So like a workspace account is always better, but you can still make one with a personal account you just have to set it up in different way through like the Google Cloud platform. So it's a bit more legwork, but it's still like fine to use that way.

Tiffanie Rothwell - 20:41

Okay. Okay, cool. So I did some research last night on. We're doing a lot through Telegram because it just seems to be the easiest way to get the bots to go straight through Telegram. But I read that there's kind of like a workaround with imessage through Apple Scripts. If I have my computer always open and there's a bot inside my. My actual iMessage itself, like my own Mac, what's it called, the Apple ID or whatever it is, then I could get messages sent through bots to imessage. Is that something you've seen as well?

Teemu Lahdenpera - 21:25

I've seen one person on these calls like working on something similar, but it was quite a bit more complex than using Telegram.

Tiffanie Rothwell - 21:33

Yeah, yeah. Okay. Yeah. Okay. Now this is the biggest question. So Mike is currently some, I think we've talked about this in the past, but some of his businesses are on native reserve land, so he doesn't have the same laws as the rest of Canada. So he can sell products that would technically be, you know, not sold outside of an indigenous territory. Like they have a few cannabis locations and things like that I know are legal in other countries, but they're not in. His concern is if we put everything on Claude and it's with Anthropic, then we're sending all that data and it could be hacked or it could be intercepted in some way. He started sending me, I think it's called Hermes or Open Claw.

Tiffanie Rothwell - 22:29

What, what would you tell me, like, how should I structure all of this so that when he's ready to migrate everything onto something like that, an open source type of platform, you know, is everything I'm building on Claude and then through aios, like is it an easy switch over? Is it very complex? What are you seeing on your end with data privacy?

Teemu Lahdenpera - 22:56

Well, in terms of transitioning, it's usually quite simple because the aios, it's a harness that sits on top of the LLM. So it's LLM agnostic in the sense that you can just plug in any provider and use the same framework. With aios, it won't really change much. CLAUDE just happens to be the most powerful one and there's a few ecosystem specific ways of doing things, like the scales and how they're structured. But generally speaking you can swap over for data privacy. I'd say most clients that I've worked with, they're fine with claude. They have their Anthropos trust portal and they list all their data security requirements and regulations that they abide by. And it's quite secure of a platform in that sense.

Teemu Lahdenpera - 23:40

It's mainly about the user error where you have to be careful like that you don't accidentally send your information to some other third party service. But a lot of servers themselves are quite secure.

Tiffanie Rothwell - 23:50

Oh, interesting. Okay. And in terms of the information getting hacked, you're saying that's actually not that possible.

Teemu Lahdenpera - 23:59

Act in the sense of like somebody hacking in Claude, like it's very unlikely.

Tiffanie Rothwell - 24:05

Yeah, yeah.

Teemu Lahdenpera - 24:06

Biggest risk is just user error, like accidentally like sending something that you're not supposed to wrong location.

Tiffanie Rothwell - 24:14

And that would happen whether it's open source or it's with Anthropic. Right. So that's like there's always going to be human error. Yeah, for sure. Okay, I, I guess this is maybe a stupid question, but I've set up all kinds of passwords for all these dashboards that I've built with all of these, all this information, I don't know how secure those passwords are. What do you see either yourself or your clients putting as security for, let's say, like, me, I'm not a developer. I'm using cloud code, you know, Fable, it's doing everything for me. Is there anything I should be thinking of to protect us more.

Teemu Lahdenpera - 24:58

In terms of which kind of workflow, like developing an application or what's.

Tiffanie Rothwell - 25:04

Yeah. So I have all the company dashboards on Claude. So I have all the data from the clients, what they're purchasing, what our business numbers are per day, per hour, every KPI that an owner of a company wants to see or a shareholder, we have them on a dashboard. Those dashboards have one sign in login and password, but that's all they have in terms of the security.

Teemu Lahdenpera - 25:33

Okay, well, for those cases, for sure, have Claude and use Fable 5 to audit the application.

Tiffanie Rothwell - 25:41

Okay.

Teemu Lahdenpera - 25:42

And then just security test it, too, because you're going to have Claude run those security tests.

Tiffanie Rothwell - 25:47

Okay, I should do that.

Teemu Lahdenpera - 25:49

I think that Table 5 might refuse to do that because it might think that you're trying to find a way to hack into an application. So it's going to say, like, no, but it still does a good job of that.

Tiffanie Rothwell - 26:01

Okay, good. Okay. Okay, I'm going to try that out. Okay. Amazing. This has been really, really helpful. I feel like you really know what you're doing with everything that I'm trying to do, you know, so that makes me feel just so much more confident. So I'll speak to Mike about everything we talked about, and then if you have any kind of material or anything you can send me about what you do for clients with your. The voice agents, the CRM, everything, like, in one packaged solution. I. I think we're going to take that very seriously. And Mike is someone that makes a decision fairly quickly, so if I give him all the information, he'll tell me, like, okay, yes, okay, no, you know, and yeah, I think you know where we're going, too, with aios.

Tiffanie Rothwell - 26:53

So I think it's just strategic, you know, that we'll have to plug it into AIOS when we're done. All the building of the foundation and. Yeah, yeah. Are there any questions I should be asking that I'm not asking because of the limited, like, experience and information that I have?

Teemu Lahdenpera - 27:11

I think it's a great starting point and everything else will just come along as you start building.

Tiffanie Rothwell - 27:15

Yeah. Yep. I agree. I agree. Okay. Amazing. Thank you. So much for your time.

Teemu Lahdenpera - 27:21

I appreciate it.

Meeting Title: Tiffanie Rothwell and Teemu Lahdenpera

Meeting created at: 13th Jul, 2026 - 1:00 PM

Tiffanie Rothwell - 27:22

See you next time.

Teemu Lahdenpera - 27:23

Thanks. I'll send that over. All right. Cheers. Bye. Bye. Awesome.

Tiffanie Rothwell - 27:25

Bye.
