

**Tiffanie Rothwell - 00:00**

To see you. I took a bit of a break from my project since last time we spoke because Mike got an opportunity to speak at a space center, which is crazy. And we had to create this, like, visual. It was in a dome, like a 360 dome, kind of like in Vegas. And we had to create, like, all the visuals and all the speech and it took up, like, all of my time. So finally this week, I'm getting back into the project and, yeah, excited to take it to another. Stephen definitely, like, needs your help. How are you doing? How has your summer been?

**Nik Volynkin - 00:36**

It's been good. It's been good. Yeah. I'm just back from, like, a short break that I had. It was good to see the family, the friends travel a bit.

**Tiffanie Rothwell - 00:46**

Where did you go? Where did you go for? To visit your. Your family and your friends. Did you travel or was it like a staycation?

**Nik Volynkin - 00:53**

Yeah, not far. Just like the cities nearby. Yeah, like, not far. So it was nice.

**Tiffanie Rothwell - 01:01**

Good for you. And I hope you've had really nice weather. I want to show you my view. I live in 600 square feet. It's really small. For me, it's fine. But upstairs in the building, there's, like, a common area. I think you can see how. But I live in the city and I don't know if you can see, but there's like the water and the city of Montreal and the canal. So.

**Nik Volynkin - 01:23**

Yeah.

**Tiffanie Rothwell - 01:23**

And I don't have to pay for the office space, which is great. And there's like a dog park right in front where I bring my dog, so I get to see all the dogs. And. Yeah, I'm just feeling, feeling super good. So thank you again for meeting with me. I'm going to go ahead and share my screen with you so that I can show you I am prepared for today's meeting. Let me know if you can see. Yes. Okay.

**Nik Volynkin - 01:47**

I was wondering if it's the real background, if it's like a, you know, like the zoom backdrop thing.

**Tiffanie Rothwell - 01:52**

Right. It almost looks like it's fake, but it's real. So funny. And it's so weird no one comes up here. Like, the building has maybe like a hundred condos, but no one comes up here. So I feel like it's my own, like, personal office. You'll probably see at some point, like, someone walking by because the gym is right next to here. But besides that, I feel like it's pretty private. Okay. So I'll remind you what I'm working on and remind you the stack that we have.

**Nik Volynkin - 02:22**

So.

**Tiffanie Rothwell - 02:22**

So we have supabase it's self hosted. We have mysql we have Python and the new. We also have. Yeah. PHP 8.5. So that was something that you and Valera and Temu told us to get. So we upgraded and we got that. What I want to do today is that I want to connect. Yeah connect the CLI Supabase. So I've been given access to the server, I've already tested it. Last time we had a meeting were blocked by that. Now I've been unblocked and yeah, I just want your help in connecting Sugar based CLI mpc.

**Nik Volynkin - 03:09**

All right, sounds good. And basically this is the self hosted one that you have, right?

Tiffanie Rothwell - 03:14

Correct. Yeah.

Nik Volynkin - 03:16

All right, let me find the documentation for that. And is it something that. Yeah, because I guess like where's the app currently lives? Is it also hosted on the same server?

Tiffanie Rothwell - 03:30

Yes, the app itself.

Nik Volynkin - 03:32

Right. And then basically you want to connect your. What?

Tiffanie Rothwell - 03:36

Yeah, I haven't connected the actual dashboard yet. Like I've just built the front end of it. I now what I'm trying to do is kind of connect to Supabase so that I can get that data, get a Telegram bot, be able to pull information from Supabase and if I show you the project itself, this is basically like my build foundation. And then what we want to do is build an intelligence layer that reads meetings, prepares for things, gives us know updates on Telegram and connects all of Mike's businesses and stuff like that. So this is the architecture that we have. It's a self hosted server. These are the automations, this is the database. Yeah, there are 400,000 rows and there's a refresh every day. So that's what we want to pull from.

Tiffanie Rothwell - 04:37

And yeah, if you need any other information about it, I feel like this now has like all the info on what we currently have access to and I'm very open to whatever you suggest would be the best solution.

Nik Volynkin - 04:52

Got you guys. And then do you do the development on your local cloud code?

Tiffanie Rothwell - 04:58

Correct, correct. I put it through GitHub in our repository and then we have a domain and this is officially like live. But yeah, I don't know if that answers the question. I'm sorry. I wish I was as like technical and knowledgeable as you guys.

Nik Volynkin - 05:20

It does, it does make sense. So I'm So at the moment, basically you would like to connect to the Supabase MCP with your cloud code so you can create the right tables. Yeah, okay, gotcha. So and then do you know, by any chance, do you run it inside the docker container, inside the server, or what is the setup there?

Tiffanie Rothwell - 05:47

Can you say that again?

Nik Volynkin - 05:49

Do you know if there is a docker running on the server?

Tiffanie Rothwell - 05:53

On the server? Let me ask. I have a lot of info in the project that I've built, so let me ask log code and see what it. Did you get to use the. The five Fable while it was available to us? Did you. Was it crazy?

Nik Volynkin - 06:16

Yeah, we literally like one and a half days.

Tiffanie Rothwell - 06:18

We.

Nik Volynkin - 06:19

We used it with the team and yeah, it was good while it's lasted. A great model. Yeah, yeah, like some work on the, on the projects.

Tiffanie Rothwell - 06:29

Yeah, I've heard, I heard. I didn't get a chance to go into it. Mike sent me a text, he's like, you gotta check it out. And then by the time I went into it, they had blocked it. He told me that the government blocked it or something because it's too powerful. That's insane. So insane.

Nik Volynkin - 06:44

Like some. Yeah, like political games in us because basically, yeah, like the Trump administration, I don't think they like anthropic very much. And so there was like, yeah, some report that apparently someone from Amazon came to them, said, hey, there is this, you know, this like a jailbreak opportunity, which is. Actually works the same way with like OpenAI models, but OpenAI has like much better relationships with the administration. And so basically, yeah, just like a political stuff that's going on, but hopefully it's unblocked soon.

Tiffanie Rothwell - 07:14

Oh yeah, I'm sure Mike said the same thing. He's like, it's just a matter of time before we have access to it again. It's still kind of thinking. So I asked it, what is the docker running on the server? That's the question, right?

Nik Volynkin - 07:27

Yeah, like if we have a docker running there.

Tiffanie Rothwell - 07:30

Yeah.

Nik Volynkin - 07:33

And also just sort of one question on the server side. So have you tried connecting to the server, like association to it?

Tiffanie Rothwell - 07:42

No, he just gave me the access to it and I was able to click and put my login. So now I can access the server. From what I understand.

Nik Volynkin - 07:56

I, I see. And is it possible to SSH to it? Do you have like. Okay, so.

Tiffanie Rothwell - 08:05

Yeah, yeah, that's what he put. Before using ssh, do the following and I think he gave me to access to ssh. Yeah, I'm pretty sure. I'm pretty sure he said that. Oh, no, that was for my last coaching session. Sorry about that. Let me go back to. It's still thinking about the Server. Docke question. Sorry. I wonder.

Nik Volynkin - 08:31

Yeah, but by the way, you can like, pretty much. If we can SSH to the server, we can check it ourselves.

Tiffanie Rothwell - 08:37

Oh, yeah. Oh, cool. How do we do that?

Nik Volynkin - 08:41

So, yeah, we need to find this SSH instructions, which is basically the IP address of the server and then the password. So maybe just. Yeah, or like something like that. Let's see. Okay, so this is the Ubuntu file system. Okay. Okay.

Tiffanie Rothwell - 09:02

Oh, this is says Docker. I don't know if that's useful.

Nik Volynkin - 09:07

Yeah, so it looks like the docker is installed. Okay, that's fine. Yeah. And then there should be some email with the SSH command that we need to.

Tiffanie Rothwell - 09:20

And what would be like the right. What would be the right tagline for that?

Nik Volynkin - 09:26

Try just a ssh. Just to see. See what we get.

Tiffanie Rothwell - 09:31

I'll go from the beginning.

Nik Volynkin - 09:35

I think there was one SSH access.

Tiffanie Rothwell - 09:38

Oh, yeah. Okay, let me go to that.

Nik Volynkin - 09:40

Yeah, it's actually your draft. So it's interact with the server base.

Tiffanie Rothwell - 09:50

There we go. Is it this one? I think it might be this one. Yeah, here we go.

Nik Volynkin - 09:59

Okay. Yes, yes, that's that the user password. Okay. Okay, that's good.

Tiffanie Rothwell - 10:06

Should I click on this?

Nik Volynkin - 10:09

No, we don't need to. I'm just thinking that. Yeah, it's probably because my idea was basically just give it to Claude and let it do the setup. But I think it's probably whitelisted because you. You needed to do some. Some disauthentication. Right. To whitelist your ip. Probably something like that.

Tiffanie Rothwell - 10:31

Yeah, that's what. Sorry, it's in French. But this is. This is what it's saying here. Whitelisted ip. Yeah.

Nik Volynkin - 10:42

Right. Okay. Okay. So. Yeah, well, we can at least try to connect to it ourselves. Are you on the Mac or Windows?

Tiffanie Rothwell - 10:51

Yes, Mac. Yeah.

Nik Volynkin - 10:53

Okay, so then you can open the terminal.

Tiffanie Rothwell - 10:57

Oh, yeah, I haven't opened that in so long. Can you remind me? It's command. Control Command.

Nik Volynkin - 11:05

It can be just like a terminal app or like if you. Where do you run the cloud code, actually? Is it inside. Inside the VS code or something like that?

Tiffanie Rothwell - 11:15

No, I just do the. This. The app, actually. But the terminal. How do I Terminal Mac. There was a way. I just press. Yeah, so command space, bar and then terminal. Okay, perfect. Let me open that. And you can't see that. So let me. I'm going to share my whole screen with you so that you can see everything that I'm seeing. Okay, So I have my terminal here. I'll move this. Oops. Okay.

Nik Volynkin - 11:54

Okay. Nice now let's try to connect to the server. So we need to do basically those commands from the email.

Tiffanie Rothwell - 12:03

Commands from the email. So what do I do? I highlight this.

Nik Volynkin - 12:08

So you see there is this server, the user. So what we need to do is basically for now, you can copy paste.

Tiffanie Rothwell - 12:16

The username and the password or just the username. Can I give you access to my computer? Is there a way to do that?

Nik Volynkin - 12:26

Well, yeah, there is, but it's not like we need like external software for that. So unfortunately we have to do it like that.

Tiffanie Rothwell - 12:35

Do I do just this?

Nik Volynkin - 12:38

So we need. Yeah, not. This is basically when you have this like a connection ssh, you have another username. So you see, it's like. Is it like little admin or something? This one, the one below? Yeah, this one? Yeah. So just this, without the user justice. Okay. This little admin.

Tiffanie Rothwell - 12:58

Oh, sorry, sorry. Just little admin. Yeah. And then I put it.

Nik Volynkin - 13:04

Do. Do like control C. Yeah. Okay. And now if you type in ssh, I think you don't need the capital, just basically. Yeah, yeah, ssh. And then space, you put this little admin. And then you need the sign without the spaces.

Tiffanie Rothwell - 13:31

Oh, yeah.

Nik Volynkin - 13:34

And then the IP address. So the IP is like the 7038. Yeah. This one. Yeah. And now you hit enter.

Tiffanie Rothwell - 13:43

Oh, cool.

Nik Volynkin - 13:44

And now type yes. Permanently. Yes. And then password. Yeah, this one. So not yet fully. Yeah, yeah, you need to like. Yeah, Command V. What do you do there? You can see, you can see that's the thing about the terminal. So. Yeah, and then once again. All right, we're inside. This is great.

Tiffanie Rothwell - 14:18

Really. Oh my God.

Nik Volynkin - 14:20

Okay, so we are in the server. So what we need to do.

Tiffanie Rothwell - 14:28

This is so exciting. I've never got this far in the project. So this is super fun.

Nik Volynkin - 14:34

Bit of hacking. So you need to run this command.

Tiffanie Rothwell - 14:41

I copy paste this.

Nik Volynkin - 14:43

Yeah, just like fully.

Tiffanie Rothwell - 14:45

Fully. Okay. And then enter.

Nik Volynkin - 14:49

Yeah, now let's see. Okay, we have the IP address of. We need to save that basically.

Tiffanie Rothwell - 15:02

Save what?

Nik Volynkin - 15:04

So basically you see like as the output, we got this like 172180 1. So maybe you can put it to like Apple Notes or something.

Tiffanie Rothwell - 15:14

Sure, I'll put it here just for now. Make it easy. Okay.

Nik Volynkin - 15:23

And now let's see the rest of the instructions. Well, before we do that, so IP address, The cloud code is running on the Mac. Yeah. Because let's try if the cloud would actually be able to connect to the server.

Tiffanie Rothwell - 16:17

Sure. How do we do that?

Nik Volynkin - 16:22

So let's ask it. Yeah, like try to Connect to the server and then give the same credentials we just had.

Tiffanie Rothwell - 16:31

So that was.

Nik Volynkin - 16:33

Yeah. And by the way.

Tiffanie Rothwell - 16:35

Right, yeah.

Nik Volynkin - 16:35

And on this server, is it only this project or there is like some other stuff as well?

Tiffanie Rothwell - 16:40

Oh, there's a lot on the server. Yeah, it's the whole. I think it's the whole. Yeah, I'm pretty sure it's the whole business.

Nik Volynkin - 16:53

Okay, let's not do that yet.

Tiffanie Rothwell - 16:56

Okay.

Nik Volynkin - 16:57

Because I mean it's most probably. It's fine. The Cloth is not gonna do like something crazy there and you have the opus, which is a better model than Sonnet, so it shouldn't be messing things up. But like, but do you know like in terms of. Because you bosses seems to be like pretty like AI forward.

Tiffanie Rothwell - 17:20

Yes, extremely.

Nik Volynkin - 17:24

He's probably would be fine with us access to Claude.

Tiffanie Rothwell - 17:28

Yeah, yeah, he is fine with that and there are quite a few measures that the developer put in place. So I think if this is what it takes to go to the next level of the project, I think we should give it a shot. What do you think?

Nik Volynkin - 17:47

Yeah, because we can do this setup manually. You can try if we have time or we can just basically give it to the cloud code.

Tiffanie Rothwell - 17:58

I would love to get it to cloud code just to see if it can access it because I feel like that would solve a lot of my problems and I would just be prompting Claude code. Right?

Nik Volynkin - 18:08

Yeah, yeah, that would help actually.

Tiffanie Rothwell - 18:10

Yeah. And Mike's tried to connect the server also through his Claude and you know there's. He's very like you said, pro AI. So should I just press enter and see?

Nik Volynkin - 18:22

Yeah, let's try. Yeah, yeah. Because indeed if it does connect then you can move faster with the project with all the configurations and everything.

Tiffanie Rothwell - 18:33

Yeah,.

Nik Volynkin - 18:36

Yeah. One thing is like we kind of in the middle of the context window. Going to take some time but yeah.

Tiffanie Rothwell - 18:46

And then what would be my next step if I wanted to. Basically what I want to do is get to Telegram bot. Is it like a lot of steps after the CLI to get the telegram bot to give me data or is it pretty simple to set that up?

Nik Volynkin - 19:07

So the telegram itself is pretty straightforward but the step you have before this authentrals, this could be like a bit of a setup there.

Tiffanie Rothwell - 19:15

Okay.

Nik Volynkin - 19:19

It's basically depends if you. Because you have the self hosted Supabase, I don't know if it supports the authentication. We need to check that because the superbase itself, it has its native way to do the authentication and user Management which is quite good. But let's see if it still posted one. That's it.

Tiffanie Rothwell - 19:45

Sure. And I think he set up a. I think he set up a separate. Don't remember actually. Let me go see. Oh, I'll try. This is your own Project Server Import 22. Should I put allow once or always.

Nik Volynkin - 20:10

Allow always.

Tiffanie Rothwell - 20:13

For Andre. Set up the firewall only lets allow listed IPs through and my sandbox IP isn't on that list. I can't log into as you. So this will probably time out of the firewall. Exactly the symptom from your coaching call. Always allow again.

Nik Volynkin - 20:29

Yeah, yeah, always allow. And then you can also like in. In this mode. So you don't need to like always allow things to basically purchase reachable. Yeah, always allow. And now you see there is this accept edits. So if you click there.

Tiffanie Rothwell - 20:46

Oh yeah.

Nik Volynkin - 20:47

And then you can do like auto mode or well bypass permission. So auto mode. Just. Just bypass for now.

Tiffanie Rothwell - 20:57

Okay.

Nik Volynkin - 20:58

Yeah.

Tiffanie Rothwell - 20:59

And then allow once again.

Nik Volynkin - 21:02

Yeah, it's letting it remove. Let me actually connect. Okay, let's see if it gets blocked or not.

Tiffanie Rothwell - 21:16

Crossing my fingers. Connected. Oh my God.

Nik Volynkin - 21:25

Okay, nice. So yeah, you see a lot of the super bases and things like that and so basically give it this link then say that we need to set up the MCP to use in our cloud app.

Tiffanie Rothwell - 21:52

But just like this. Right? Set up the MCP to use in the cloud app.

Nik Volynkin - 21:56

Yeah, like you're gonna even put like in. In our cloud app so it knows that in.

**Tiffanie Rothwell - 22:01**

In our. In my. Okay, cool. Man, you really know your stuff. How long did it take you to master Claude?

**Nik Volynkin - 22:16**

I mean, hard to say. I do have technical experience like engineering school and work as a developer for like three and a half years. And so yeah, this sort of stuff kind of. Kind of makes sense.

**Tiffanie Rothwell - 22:30**

Great foundation to build on. Yeah. You must find this new world of AI crazy and limitless. I guess especially with the knowledge that you have.

**Nik Volynkin - 22:42**

It's fun. It's fun. Because that's like one thing that I always enjoyed. Creating the products and like thinking on the business side and writing the code is something that you needed to do. But now it's just. Yeah, kind of this. This problem is solved. You have to think from the architecture and the. And the business side more.

**Tiffanie Rothwell - 23:05**

Nik. How do I see the picture of you so that I can see when you're speaking? How do I get rid of like my preview? Do you know?

**Nik Volynkin - 23:14**

I think you can like resize it. Yeah, something like that.

**Tiffanie Rothwell - 23:18**

Maybe this. Okay, maybe that's good. Okay, great. Now I can see you. So this now says this. I'll make this bigger. I don't think. Do I need the terminal anymore? For the terminal over here.

Nik Volynkin - 23:31

Yeah. Keep it just in case. But basically you don't need the cloth. Get it already. Changes.

Tiffanie Rothwell - 23:44

Blocked by default.

Nik Volynkin - 23:52

Yeah. So basically, yeah, the quote should be able to figure it out.

Tiffanie Rothwell - 23:57

Oh, great.

Nik Volynkin - 24:01

Yeah. And then start agents, of course, System CP server. And then basically, yeah, you would need to.

Tiffanie Rothwell - 24:11

Which cloud app should I wire this cli. Right,.

Nik Volynkin - 24:19

Let's do both. Yeah.

Tiffanie Rothwell - 24:21

The server side needs a Kong configuration. Edit Kong restart on Andre's production box. A brief API that affects.

Nik Volynkin - 24:31

It's fine. Proceed now.

Tiffanie Rothwell - 24:33

Proceed now. Okay, great.

Nik Volynkin - 24:41

Yeah. And then do you. Basically you only run the cloth as an app, right. You don't use it from the terminals and stuff like that?

Tiffanie Rothwell - 24:52

I mean, I could if. I think if you tell me to, I will. I just feel like I. It's more out of habit, you know? Like, I feel like I've got used to using this and I feel like it's comfy for me. But if you're. If you say like, okay, Tiff, you have to use Terminal, like, I'll get used to using this.

Nik Volynkin - 25:11

Yeah. I mean the only thing is basically this MCP connection because it works. It works differently on. On the terminal and on the app. So let's just see if we would be able to set it up with the app. Yeah. Because now it tries to do it. So if you can connect it, then. Yeah, basically no need for the terminal. You can just do it here.

Tiffanie Rothwell - 25:36

That would be great.

Nik Volynkin - 25:40

Because actually if you run it through a VS code, it also has the same interface. Basically, if you have the app, the anthropic app there. So it would look very similar to this one, not as like different as the terminal. So in case you have issues with mcp, that would be the solution.

Tiffanie Rothwell - 26:01

Okay. Yeah.

Nik Volynkin - 26:13

Restarts.

Tiffanie Rothwell - 26:19

It's so fast. Opus 4.8 find.

Nik Volynkin - 26:25

Yeah. And also like when you do this kind of development work, you can switch the effort a bit higher as well, because now it's in the medium, which is like. Okay.

Tiffanie Rothwell - 26:36

I did not know that was even possible. What should I put? Ultra code.

Nik Volynkin - 26:41

I know. I mean, you. You probably don't need that. I would just like extras. Extra high is good. Yeah.

Tiffanie Rothwell - 26:47

Oh my God. I didn't even know that was a thing. Thank you so much. Mike has given me unlimited tokens. Unlimited. Whatever it is that I need. So thank you for. Yeah, I. I thought that is so. I'm so stupid. I thought that was telling Me how much effort it took it to do the things not me giving it, like allowing. Oh, that's so funny.

Nik Volynkin - 27:11

Yeah, it's basically like this reasoning tokens budget which is you don't need every time. If it's like, you know, like back and forth, some interactions, it's fine.

Tiffanie Rothwell - 27:19

Yeah.

Nik Volynkin - 27:20

If you're doing some development stuff, usually it helps.

Tiffanie Rothwell - 27:23

Yeah, yeah, I totally get that. So now the client side, Now it's really doing a lot of stuff. Yeah, it says it works.

Nik Volynkin - 27:41

So I'm going to use the apps. Yeah, it's cool.

Tiffanie Rothwell - 27:48

This all sounds like a different language to me. Create and load tunnel launch Agent vi, mtv. It honestly doesn't sound like English.

Nik Volynkin - 27:57

Yeah, the funny thing that the AI can like set itself up, you know, do this debugging and everything.

Tiffanie Rothwell - 28:07

SSH is an item that can run in the background. You can manage this and login. Cool. Okay, I'll click that X to know. Wow. It's looking like it's working, right? From what.

Nik Volynkin - 28:27

Yeah, yeah. At least so far. Yeah. Like we did expose this URL from the server. Now it basically creates the connection so we can access it from the cloud app. Yeah, cloud code is connected now. The desktop remote bridge backup. Yeah, that's what we need. Yeah. How did the mic stock go?

Tiffanie Rothwell - 29:13

It was actually really good. It was in front of like some pretty key people in his community and it was his first time giving a keynote speech ever and he killed it. I mean there was a lot of preparation, but he just, you know, he's someone who goes to like all the Tony Robbins events and really like is so good with like mindset. And the morning of, I swear to God, I would have so much anxiety, I don't think I would be able to speak. And we met like in the hotel coffee shop and he was just so like ready, you know, he was confident and ready. And there were about. Through the whole three days, there was probably like 10 keynote speakers. But his was the most memorable out of all of them. So I was really happy for him.

Tiffanie Rothwell - 30:05

And he shared a lot of like personal, you know, he started his company from a literal shed and we put a picture of it. It was like a \$1200 shed. And then he grew the companies to be. Last year they closed at \$60 million in volume and.

Nik Volynkin - 30:21

Wow.

Tiffanie Rothwell - 30:21

It's just. Yeah, there was a lot like I, I got emotional in the speech because he's just a brilliant person, you know, and so humble. So, yeah, it was great. Thank you for asking.

Nik Volynkin - 30:35

Amazing.

Tiffanie Rothwell - 30:36

What is this?

Nik Volynkin - 30:41

Yeah, let's Take a look the config, but the green and gold. All right, so yeah, let's actually, let's click this relaunch to update button. Oh yes, hold on. Not yet, not yet. Because we need to restart the app first. So you can click this relaunch to update.

Tiffanie Rothwell - 31:08

So we on the latest relaunch to update this.

Nik Volynkin - 31:11

Sorry, there's this like a button on the left that you can see.

Tiffanie Rothwell - 31:14

Button on the left. Button on the left. Oh no, I'm sorry, where is it?

Nik Volynkin - 31:20

Even more, even more like all the way to the. Yeah.

Tiffanie Rothwell - 31:22

Oh, this one. Yeah. Okay, cool.

Nik Volynkin - 31:27

Yep. Now let's see if you open the same session. And now if you click on this little plus button.

Tiffanie Rothwell - 31:34

This one.

Nik Volynkin - 31:35

Yeah, and the connectors. So let's see. Oh, super base of hosted. We actually have it. Okay, yeah. Then in the chat, let's ask. Yeah, test now.

Tiffanie Rothwell - 31:53

Yes, just test now.

Nik Volynkin - 31:55

Yeah, Let's see if it works.

Tiffanie Rothwell - 32:05

Send my fingers.

Nik Volynkin - 32:08

Yeah, Yeah, I think it showed the right connection there. It was this will base self hosted. So hopefully it works. Yeah, now it takes a bit of more time to respond with this extra reasoning, but yeah, that makes sense.

Tiffanie Rothwell - 32:40

That makes sense. And obviously at the very end, the MPC tools are now live in the session. Let me load and exercise them. Cool. At the very end of this I'll update my project management site so that it has all this new info. You're a really great coach, by the way. Really, really great. Like I feel like this is like a workshop coaching session. I'm very grateful. Mike tells Liam all the time, like how grateful I am for all of this help. So I hope that makes it back to you because I for sure have mentioned you and Valera and team.

Nik Volynkin - 33:18

You appreciate it a lot. For sure. For sure. Yeah, it looks like it's working actually.

Tiffanie Rothwell - 33:24

Yeah, yeah.

Nik Volynkin - 33:25

Now connects to the server.

Tiffanie Rothwell - 33:28

Start the first Chocobar module. What's that? Oh, cool. I don't know what that is.

Nik Volynkin - 33:39

Yeah, I mean, kind of like just suggests you some like next steps. But now basically your cloth is connected to the database and now. Yeah, you can do the work on that. And then I would also suggest to. When you like for example, do like a task switching and then you work on something else. You can just start a new session because then you'll get better results even if you. When you compare it to when you do everything in one because the.

Tiffanie Rothwell - 34:08

So how do I do that? You can just start a new session straight up from there.

Nik Volynkin - 34:13

Yeah.

Tiffanie Rothwell - 34:14

Okay, so then if my next step is the off Authentication roles. I would click new session.

Nik Volynkin - 34:21

Yes, I would do this one out for sure. Doing the new session.

Tiffanie Rothwell - 34:24

Yeah. Okay, so what would be my prompt for that?

Nik Volynkin - 34:31

So do you have like a state of the app at the moment you. You showed me? I think it's deployed, yes.

Tiffanie Rothwell - 34:40

This is it right here.

Nik Volynkin - 34:43

Yeah. And because it does have this like hub HTML. So I think it's like a mock up. Right. So it's not really.

Tiffanie Rothwell - 34:57

Nothing's connected yet.

Nik Volynkin - 34:58

Yeah. Okay. Okay. Okay. So I guess the step one would be. Actually it's a good idea to start with authentication. So I would, yeah, I would do that since now you have the connection to the database and then the first thing I would actually ask is whether this native.

Tiffanie Rothwell - 35:22

MJM command, enter, where is it? Oh, I don't think I made it live, actually.

Nik Volynkin - 35:37

Yeah. And what is your development process, by the way? Do you like or do you. When you do some changes to the app, is it all through your local cloud code? Then you like, push to the GitHub?

Tiffanie Rothwell - 35:50

You got it.

Nik Volynkin - 35:52

Okay, gotcha. So let's see. It would be good to actually start it from a specific folder of your project. So would it be inside the Valero main? Would it be the local.

Tiffanie Rothwell - 36:05

Yeah, I don't know. Where should it be? Should it be the actual dashboard itself?

Nik Volynkin - 36:17

We can try to find out. So like if you open your finder, maybe if you know like where the project lives.

Tiffanie Rothwell - 36:26

Yes. So tv. Oops, lost you. So I think it's in the cloud. Coaching. Let me just go Desktop ltc. Yeah, this is the one. Yeah, so it's this one right here, the LTV dashboard.

Nik Volynkin - 36:56

Yeah. And you push the GitHub basically from this folder, Correct?

Tiffanie Rothwell - 37:00

Yeah.

Nik Volynkin - 37:02

Okay, I see. Yeah, all right. And actually, no, it's fine, it's fine. I'm just thinking that it looks like at the moment the app itself is. Is a HTML file, which is basically a mock up. So it's not like a real app. So what you need to do is basically turn it into. Into React app. Yeah, I would suggest next js. So probably even before you do that authentication, because you can do this authentication with the HTML but it's going to be useless because anyway you need to like turn it into the app first.

Tiffanie Rothwell - 37:40

Okay, so update my project page with the advice. So what is the next step? Or I know we won't be able to do that on the call together, but what's my. You said S. And what was the term you gave?

Nik Volynkin - 37:55

Yeah, so basically I would start a new code session. Started from the project folder which is sync to give to Git and then give it a task to turn to. Turn this mock up into Next JS app.

Tiffanie Rothwell - 38:11

Turn this mock up into Next JS like that. Oh, thank you. Next JS app. Okay, and then once I do that, I'll play around with it with Claude and if I hit any roadblocks, I'll schedule another meeting with you. So you're saying next JS and then next task will be the authentication.

Nik Volynkin - 38:35

That's correct. That's correct. And I did quick research. So basically you should have the same way this self hosted superbase as the cloud one in terms of the user authentication. So it's just basically in another new session you can, when the next step is ready, you can say like, hey, we need to add this authentication using the Supabase users and things like that. And then tell it that you have access to the Supabase with this tool. And so it would create all the needed tables, create this authentication flows and everything like that.

Tiffanie Rothwell - 39:10

Amazing. Very cool, very cool. Okay, that was awesome. Maybe I can ask you a small question. It's kind of like a side. It's not related to this specifically. It's something that Mike asked me. He wants us to use AIOS to the maximum that we can use it for. Maybe I've misunderstood what AIOS is or what it would be good for this project.

Now that you've seen kind of like what we're building a little bit. What is AIOS exactly for us?

Nik Volynkin - 39:44

So you mean like how it can help with the development of the project specifically?

Tiffanie Rothwell - 39:49

Yeah. What can we use it for? Like what exactly is it, you know?

Nik Volynkin - 39:54

Yeah, yeah. I mean in general it's a framework basically as an operating system for your business. So of course it's. Because if it runs on the cloud code, you can also use it for the development. But I think the biggest use case is basically for it to be connected to your business tools. For example, if you use Stripe, it could pull up your recent revenues. If you run some ads, you can get stuff from Meta and it connects to the fireflies. So it can give you this daily briefs and just the general information on running your business. But what do you do now? It's basically it's like a software development, you're creating a platform. And so for that I don't. You can do it within the iOS because there are some like good tools for that. Like for example, the plan.

Nik Volynkin - 40:43

This is actually what I suggest you to do as well. So like when you're going to work on this next. For the next one. I don't know if you need. Maybe. Maybe. Yeah. It would be actually beneficial as well. So, like, if you first just don't tell it to do the next step right away. Ask it to first do a plan, and then for you, it would be kind of hard to see if the plan is good or not, but you can trust that it's good. But basically, this is a good approach to basically do exploration, plan and execution. You always start with a plan for asking it to write any code. And this is one of the core features from the aios as well. And so it can be used for that. But I would say in general, you know, like, it's.

Nik Volynkin - 41:31

It's more for running your business other than doing the software development specifically.

Tiffanie Rothwell - 41:35

So then it's kind of like phase two, when I want to connect, like all the fireflies and the intelligence layer and the meeting preps and all of that. Then I use AIOS, and it could also get sales data from QuickBooks, for example, for our CFO and things like that. Okay, cool. So then that'll be one of the next steps. Okay. I think I'm really clear on my TO dos. Thank you so much for your help. This has been, like, our block for, I think, a month now. So very excited to continue this. And yeah, I'll book another session with you as soon as. As soon as I reach that roadblock.

Nik Volynkin - 42:13

Sounds good. Yeah.

Tiffanie Rothwell - 42:14

Thank you so much, Nik. Take care.

Nik Volynkin - 42:16

Have a good one, Tiffanie. Bye. Bye.
